

## Lab 8 – React Bus Tracker

- Introduction
  - In this lab, we were tasked with re-writing the AJAX Bus Tracker application to use React to create a table component to render the table bus data. We also had to learn how to transpile a JSX script into regular JavaScript using babel.
- Summary
  - I learned how to create a React component to render a table of data retrieved via a jQuery AJAX call, as well as how to use babel to transpile a JSX script into JavaScript.
- Suggestions
  - At first, I thought that we had to rewrite the entire program to render with React instead of just the table because of the wording of some of the directions, but that might just be me. You might want to make it a little more clear that it's just the table that you want rewritten.
